

SIGNAL on the Macintosh!!

SIGNAL can be run from the Macintosh desktop!

SIGNAL can be run on a Macintosh computer using one of several available PC emulator programs. These programs run the Windows operating system in a window on the Macintosh desktop. All SIGNAL computational, display, and programming capabilities are supported on the Macintosh, and basic sound functions are supported by the built-in Macintosh sound chip. Two current products are Parallels and VMware Fusion. Check with the vendors for Macintosh hardware requirements.

Here is an 800x600 pixel SIGNAL session on an 1152x864 pixel Macintosh desktop.
